

BLE commissioning request and result

Versioned setting commit is a proposed transaction detail. Acknowledgement means persistence accepted, not that the broker is reachable.

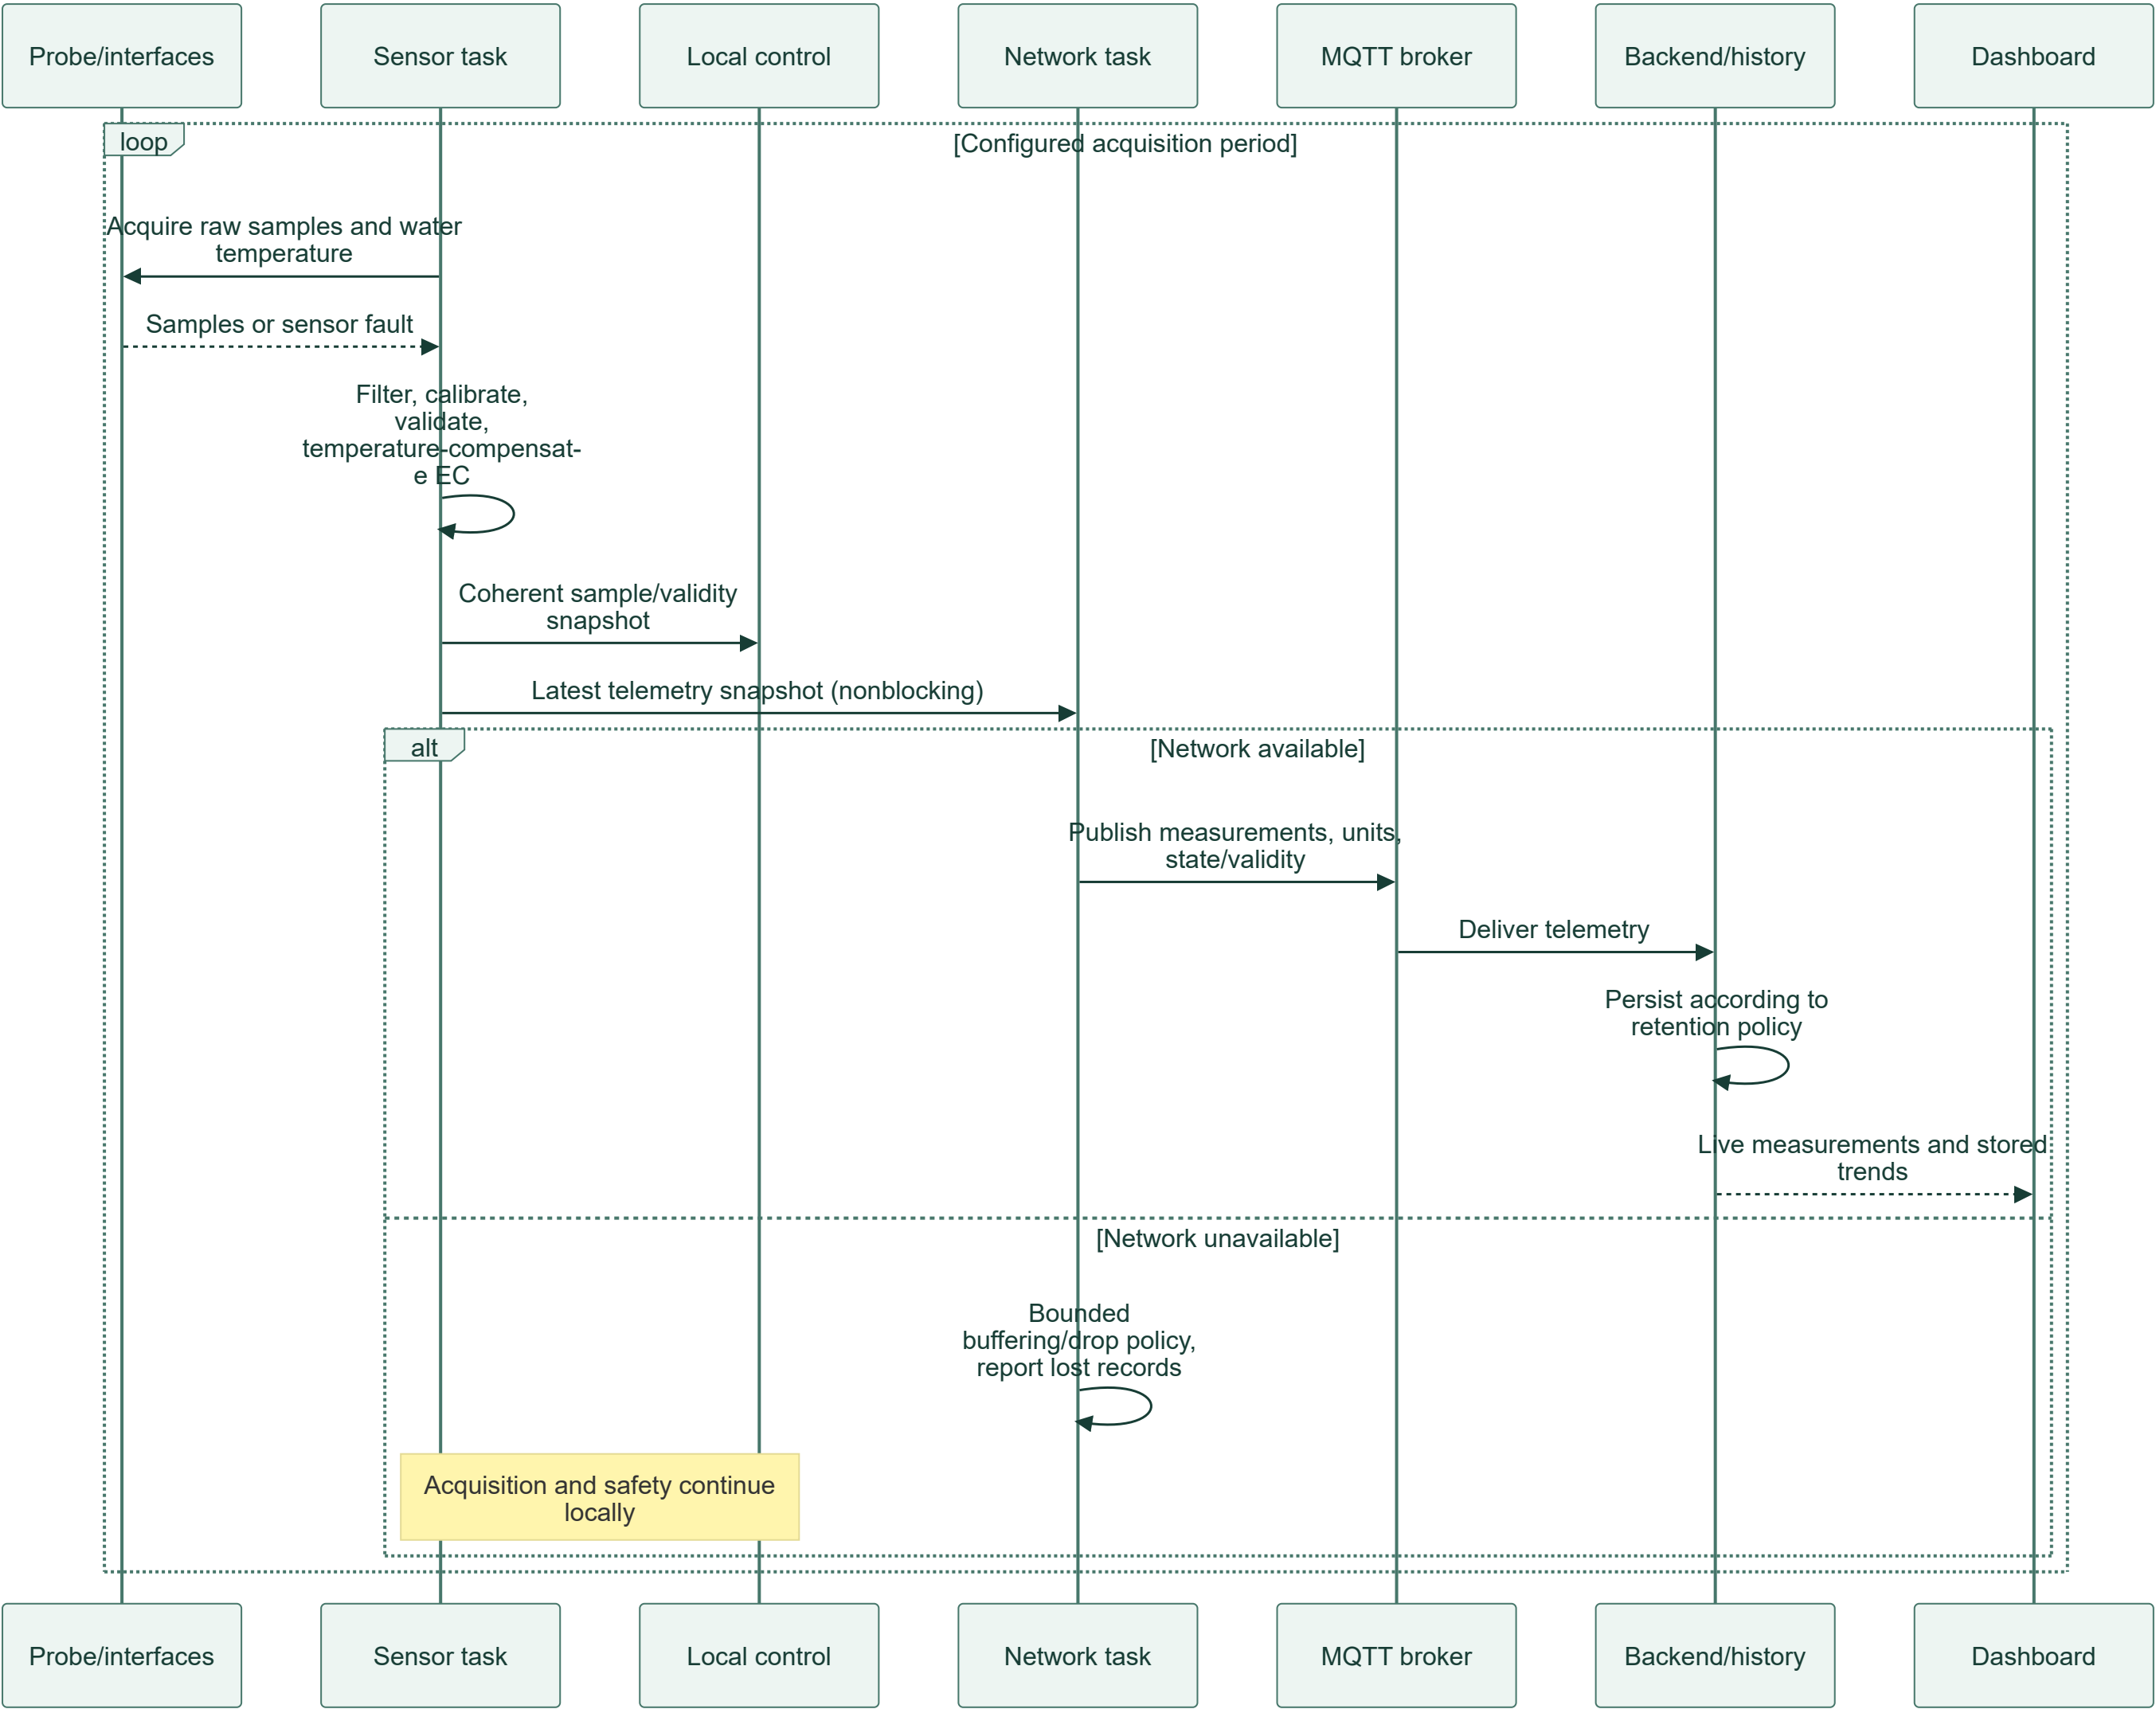

Add/update/delete under concurrent acquisition

Conceptual transaction; exact crash-consistency ordering and synchronization are open. Deletion is a registry change, not creation of a new driver.

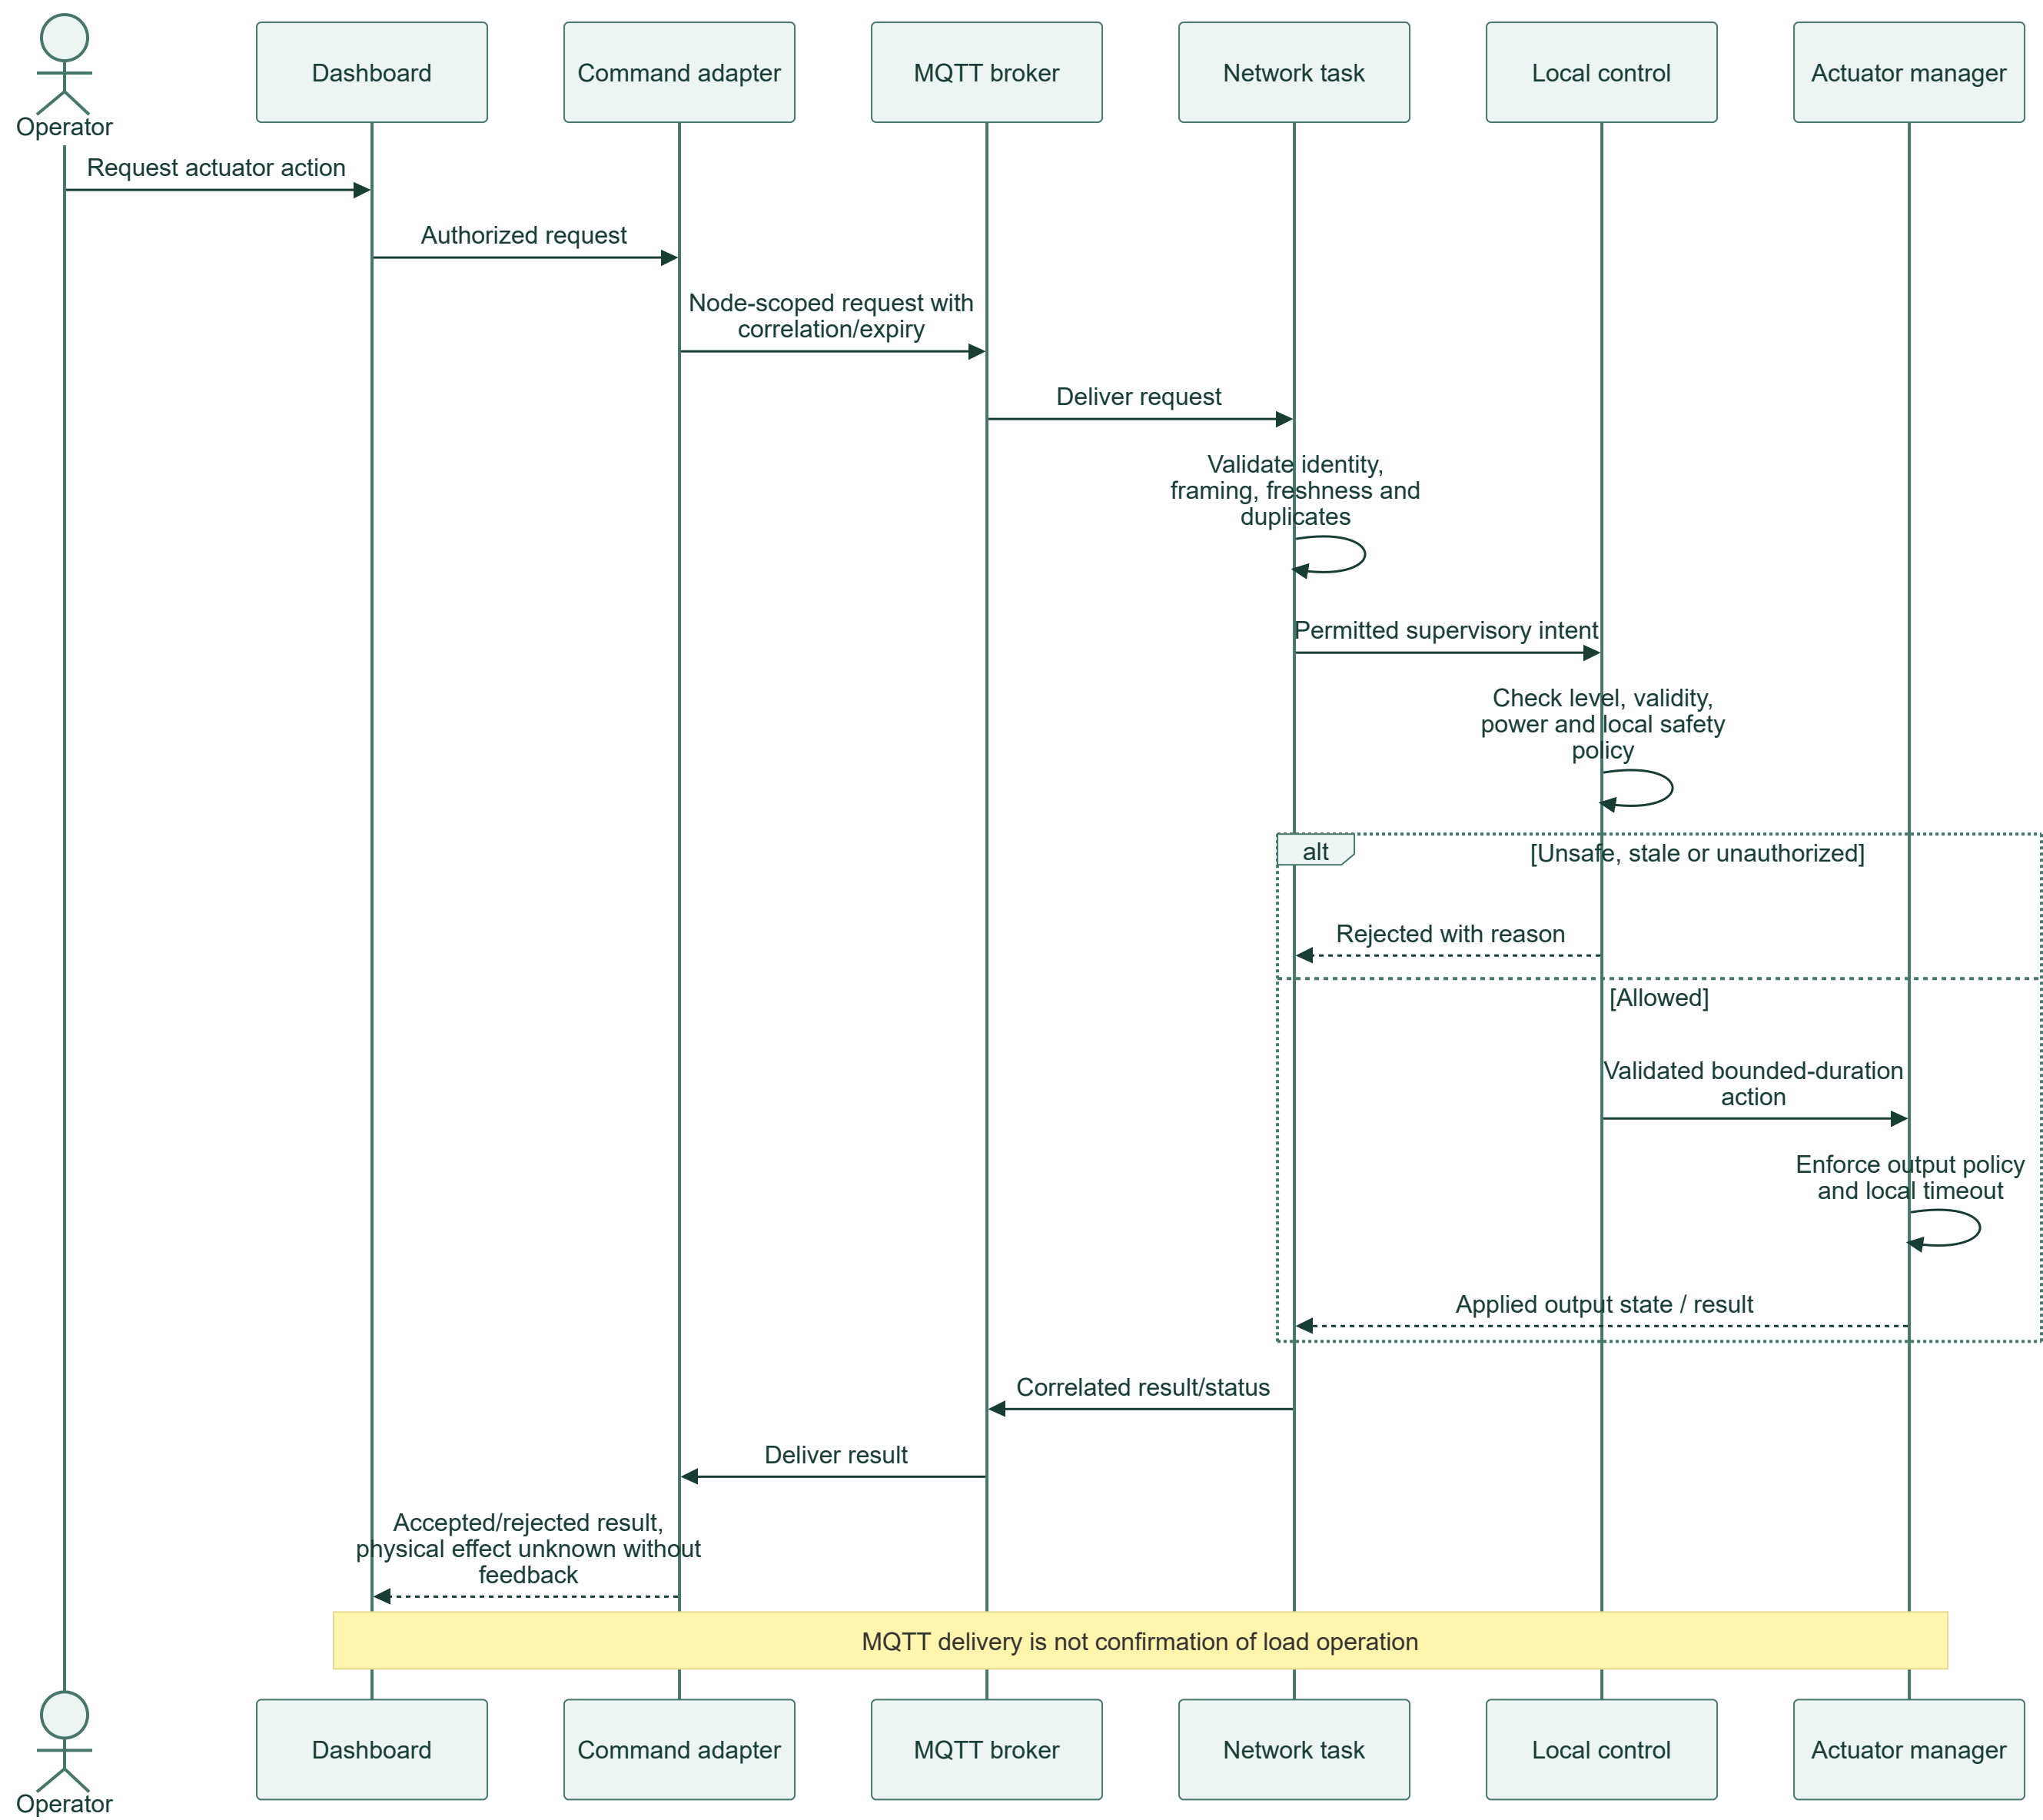

Acquisition, EC compensation and dashboard history

Envelope, timestamps, sequence IDs, buffer capacity and retention are proposed contract decisions; no numeric periods are assumed.

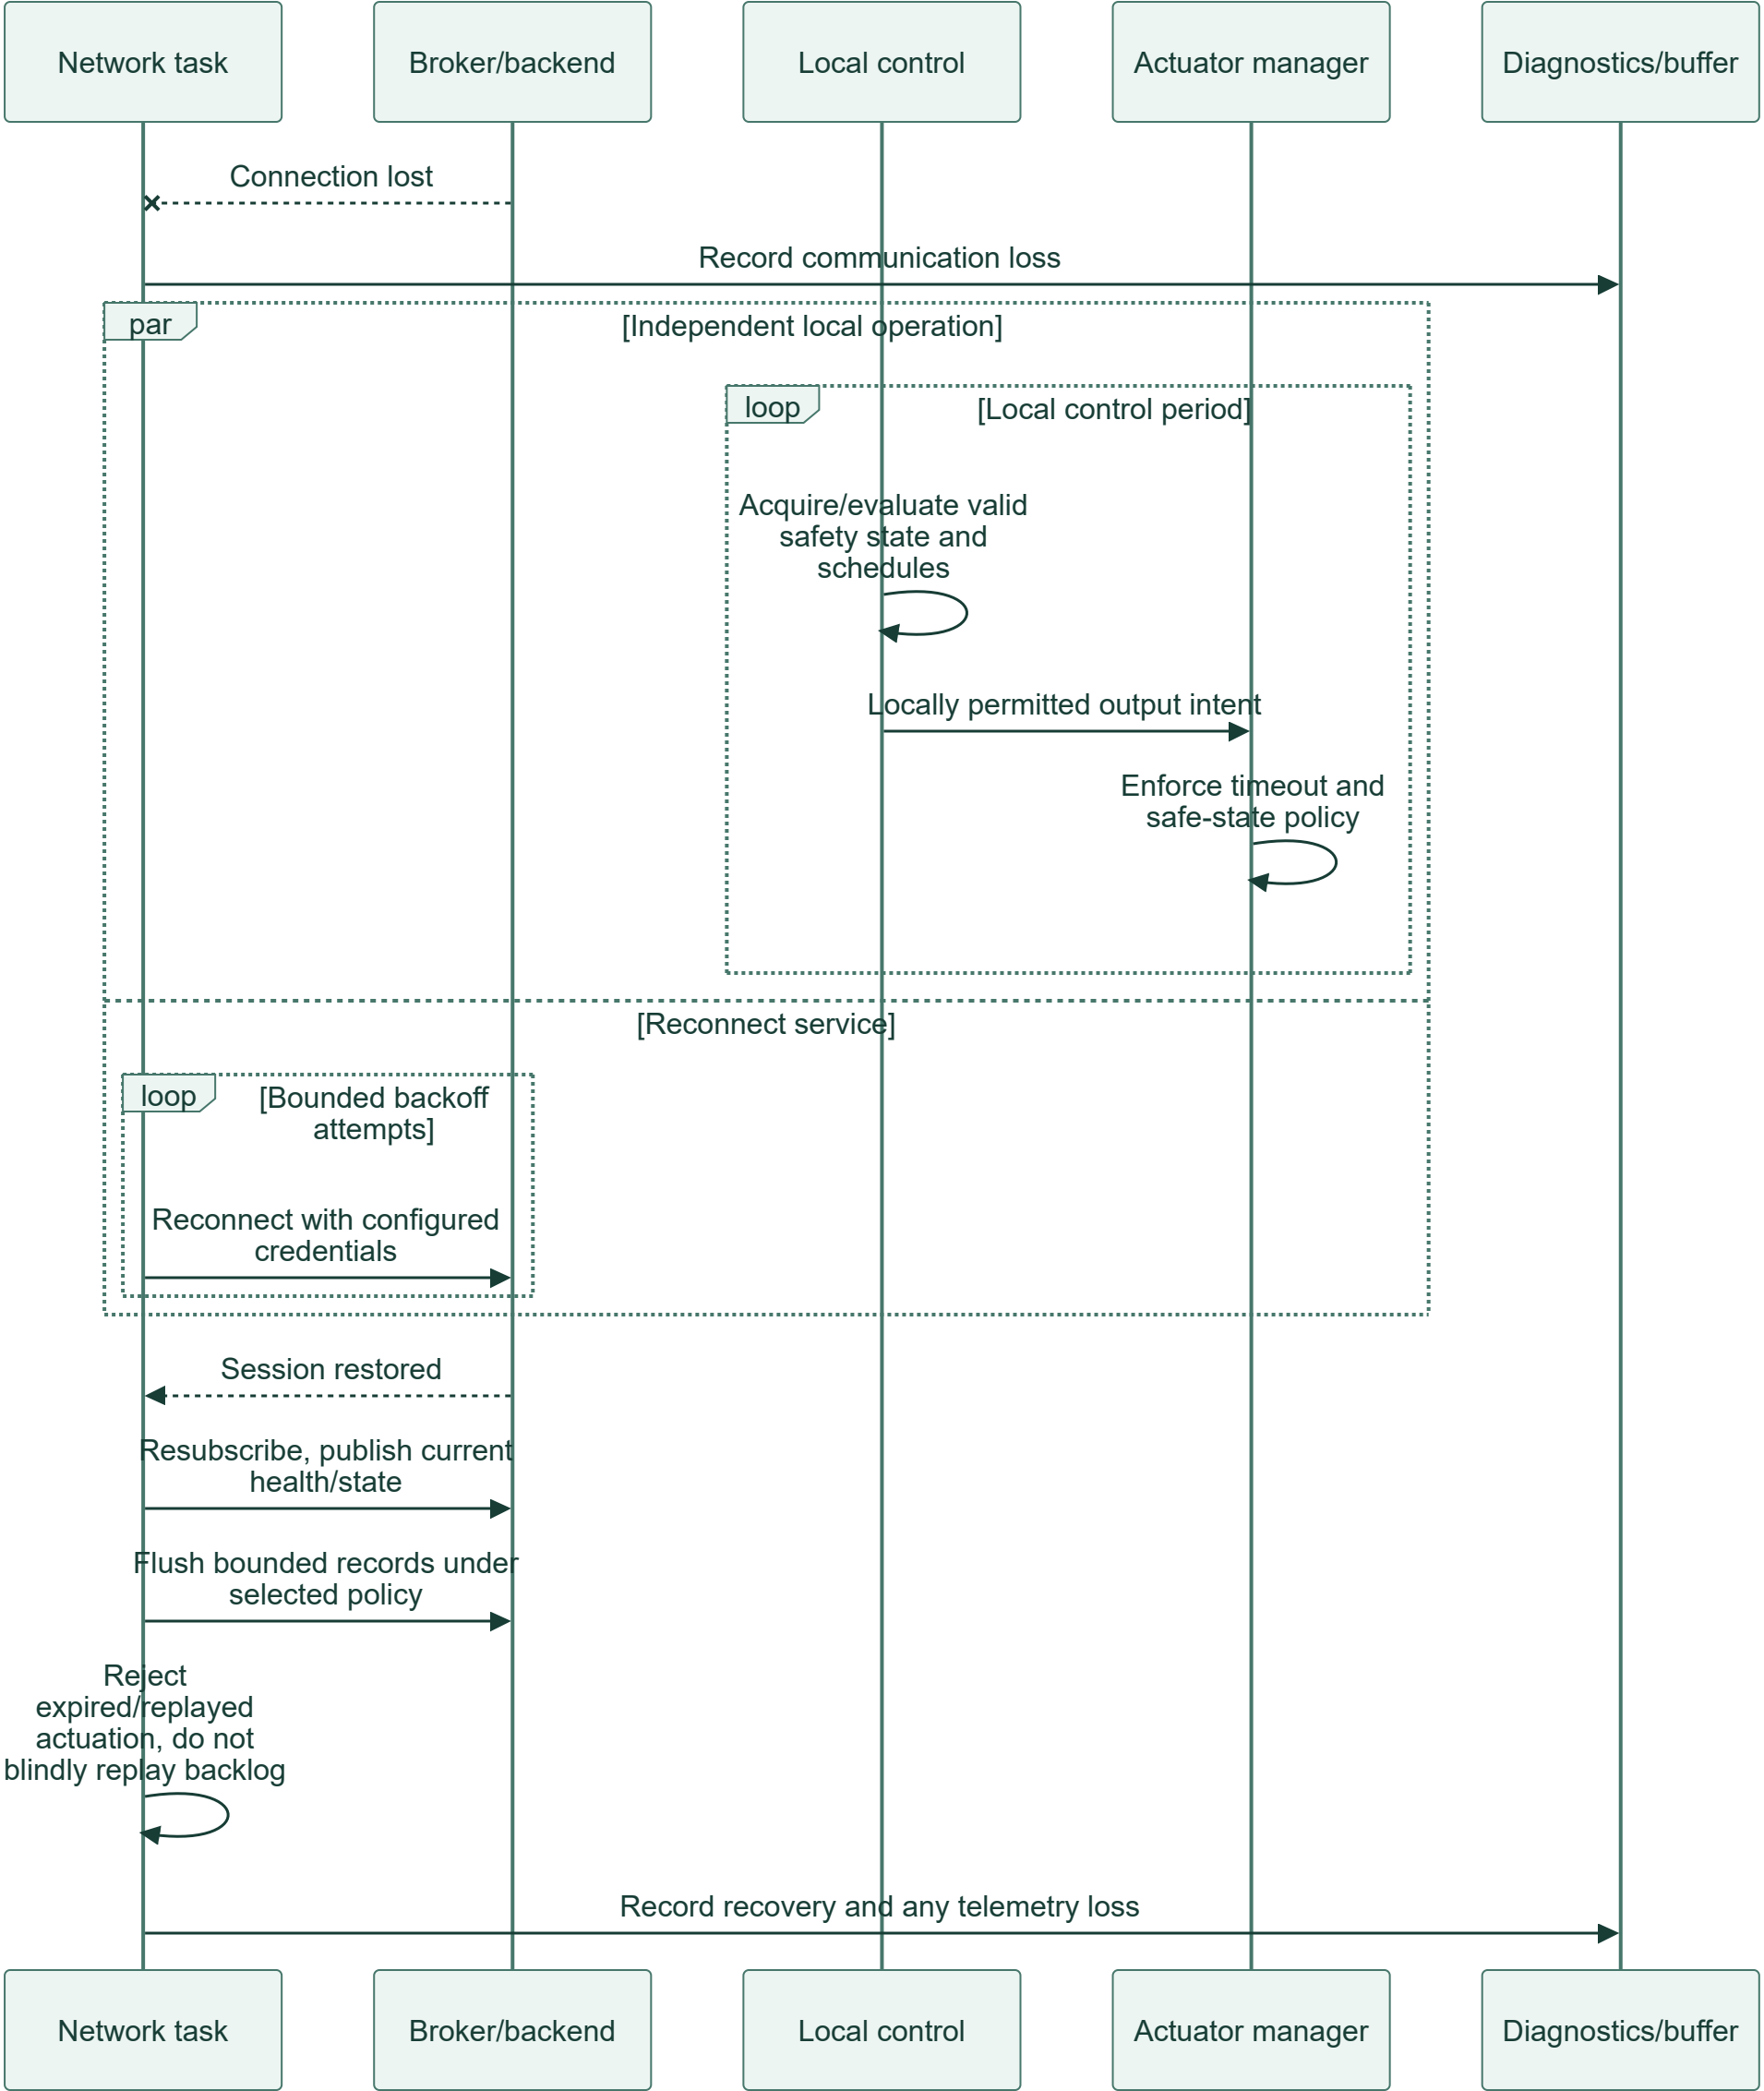

Supervisory command with local safety veto

Freshness/correlation/authorization details are derived proposals. Applied GPIO/driver state is not proof of pump flow; independent feedback requires a hardware decision.

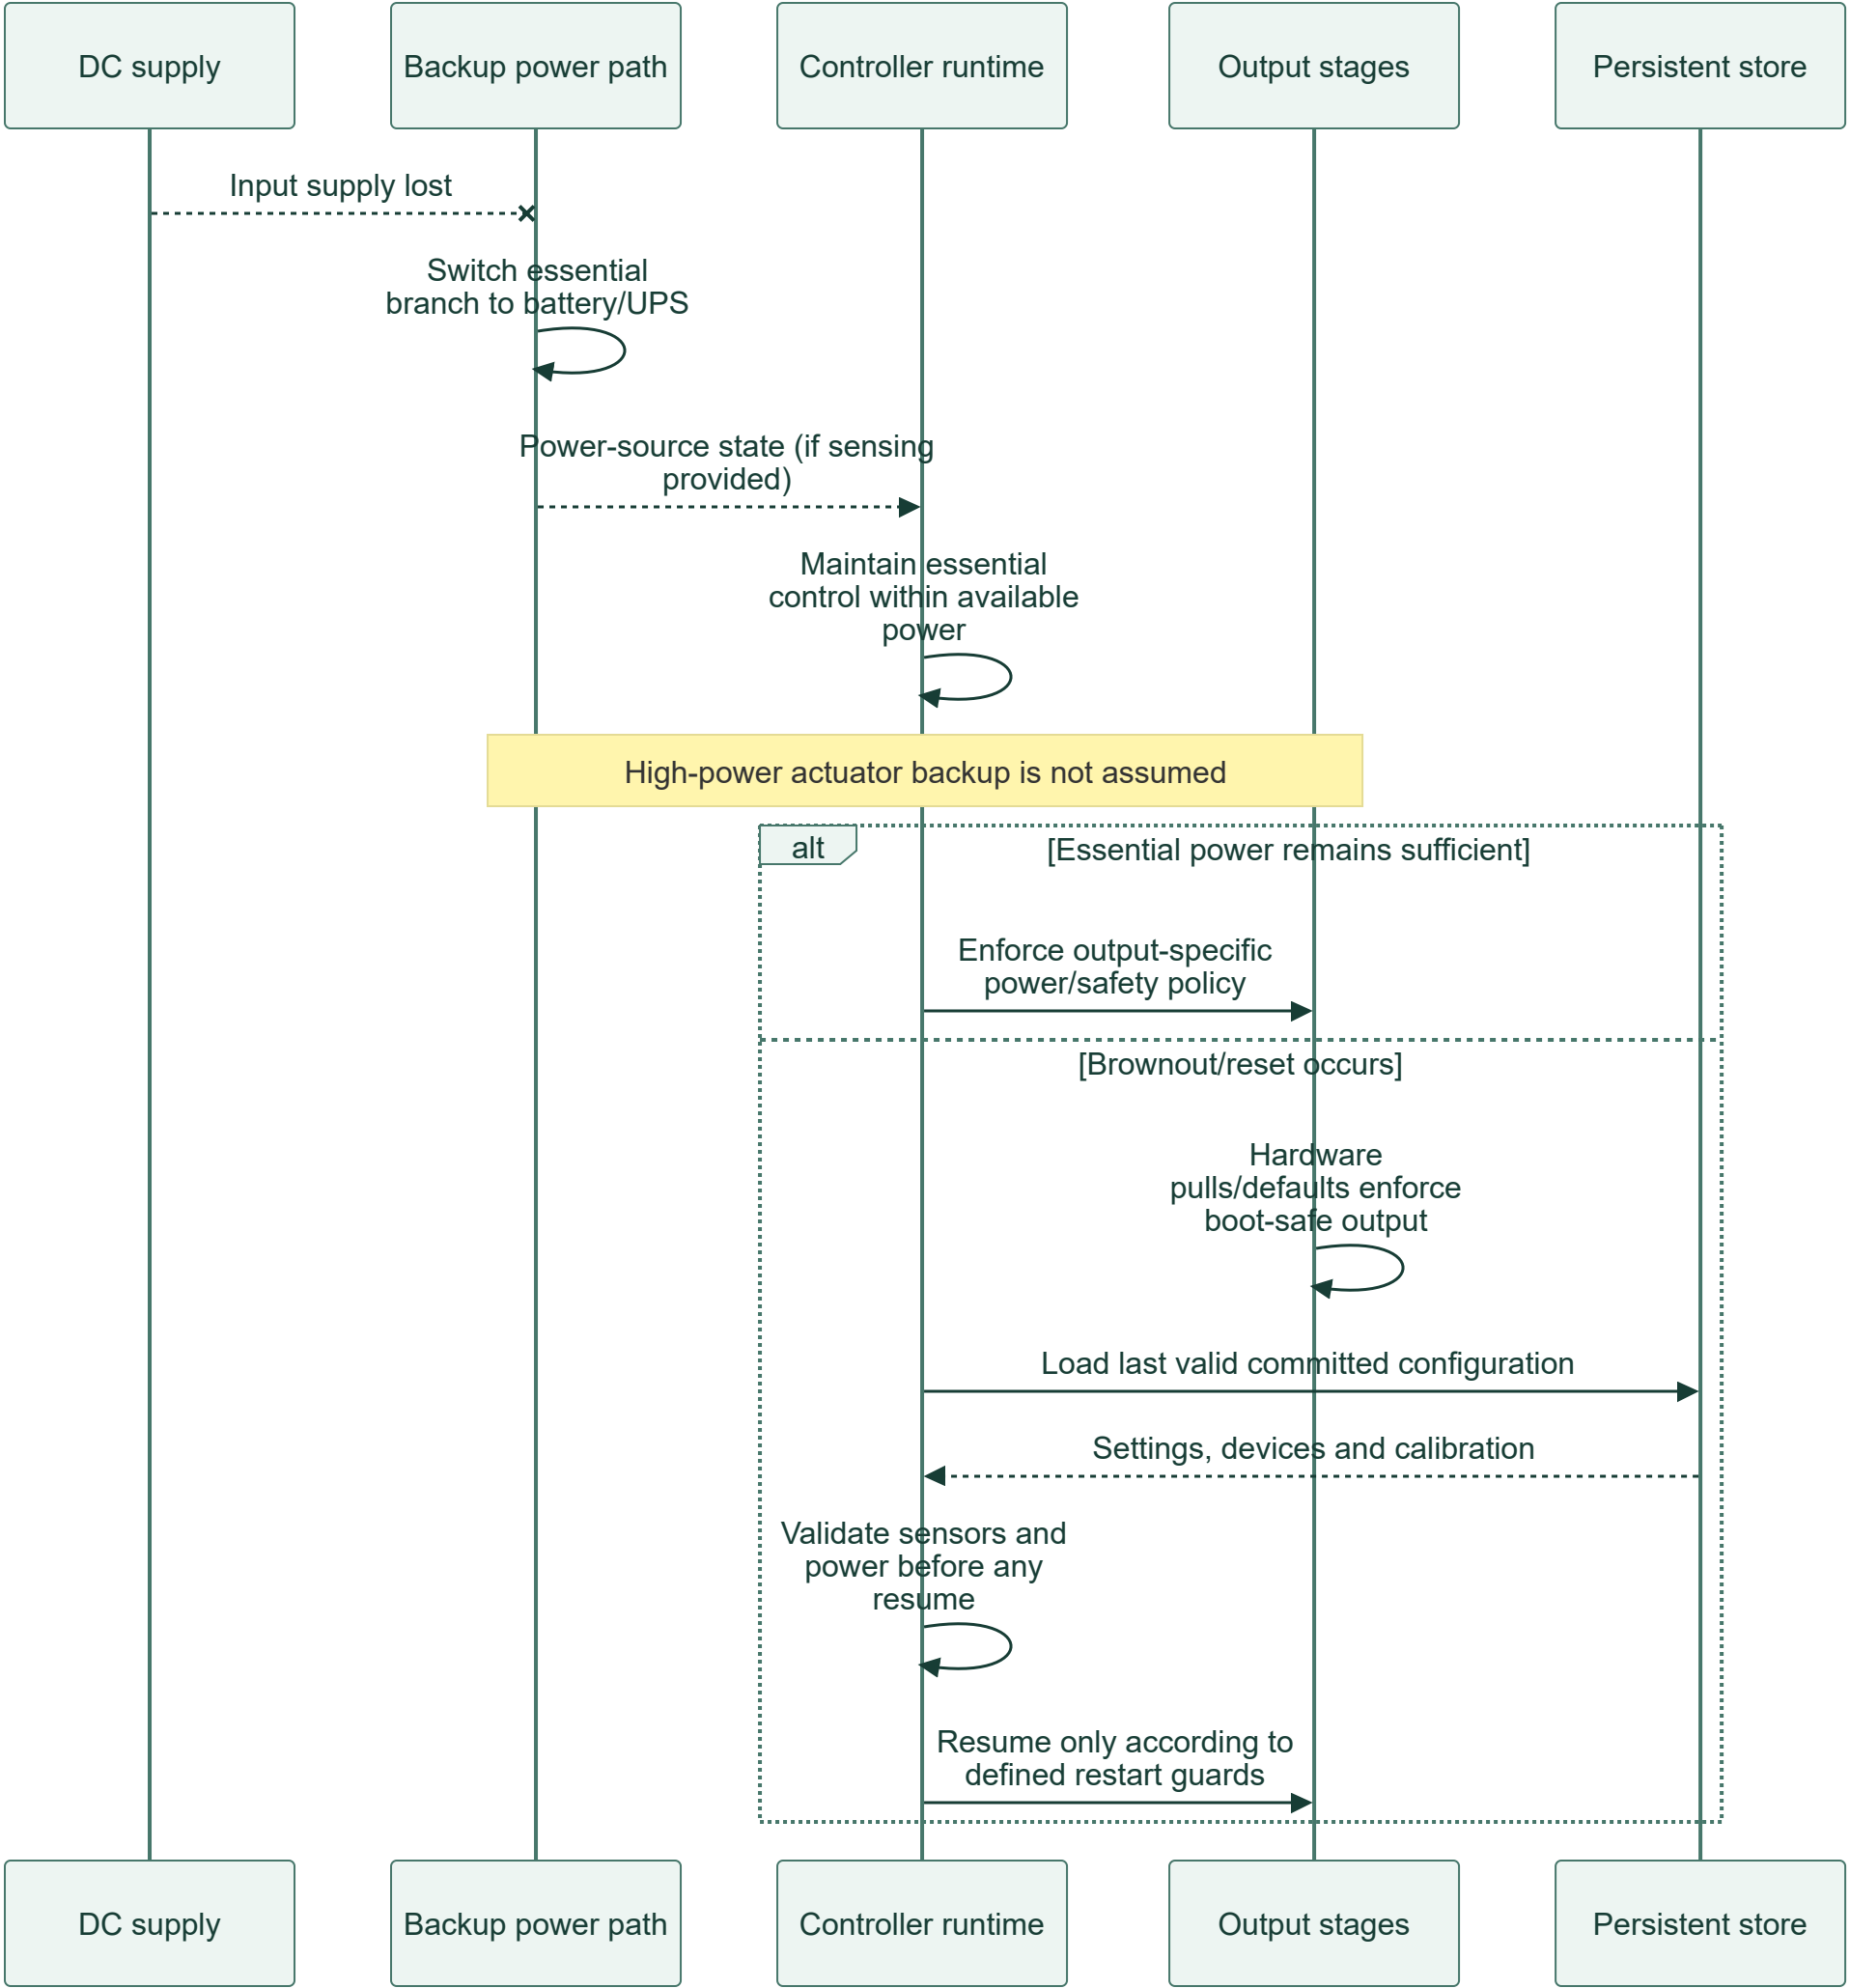

Network loss and controlled reconnect

Network loss alone does not stop healthy configured local schedules. Local deadlines, buffer policy, reconnect backoff and stale-command handling remain to be approved.

Backup switchover and brownout restart

Power-state sensing and low-battery policies are refinements; thresholds, battery runtime and resume policy are open. Firmware alone cannot guarantee reset pin safety.

sequence

Representative PlantUML graphical view; not a native executable SysML model.
